Abstract
Phytotherapy is the study of the use of extracts from natural origin as medicines or health-promoting agents. The use of herbs in dental practice is not limited to only material sciences. A single herb shows a variety of effects like anti-inflammatory, antibacterial, antifungal activity and many more. The natural phytochemicals could offer an effective alternative to antibiotics and represent a promising approach in prevention and therapeutic strategies for dental caries and other oral infections.

Keywords: Anti-inflammatory, Antibacterial, Antifungal, Phytotherapy, Dental practice, Therapeutic strategies.

Introduction
Phytotherapy is the study of the use of extracts from natural origin as medicines or health-promoting agents. Herbs with medicinal properties are useful and effective source for treatment of various disease processes. Indian subcontinent is a massive repository of medicinal plants that are used in traditional medical healings, which also form a rich source of knowledge. There are ~1,250 Indian medicinal plants that are used in formulating beneficial measures according to Ayurvedic or other ethnicity. In dentistry, they are classified according to use as:

- Antimicrobial agents
- Anti-inflammatory agents
- Sedative and anxiolytics.

Miscellaneous- endodontic irrigants, medicaments and endodontic retreatment. Even though chemo-mechanical preparation of root canal is able to reduce the number of bacteria, the intracanal medicament with antibacterial action is required to maximize the disinfection of root canal system.

A wide range of antimicrobial agents and herbal products are added to dentifrice and mouth rinsing solutions with the aim of preventing caries or biofilm formation.

Various natural products such as Curcuma zedoaria, calendula, Aloe vera and other herbs have been used effectively to treat oral diseases. The natural phytochemicals could offer an effective alternative to antibiotics and represent a promising approach in prevention and therapeutic strategies for dental caries and other oral infections.

Pharmacological applications
Antimicrobial and anti-inflammatory activity
Triphala consists of equal parts of the Emblica officinalis, Terminalia chebula, and Terminalia belerica. Anti-microbial and anti-oxidant effect of Triphala has been proven in-vitro as it has been shown to inhibit Streptococcus mutans at concentrations as low as 50μg/ml. This anti-plaque effect probably may be due to the tannic acid in Triphala, which result in protein denaturation and bacterial cell death. The extract of T. chebula may be an effective agent in the treatment of carious teeth, owing to its ability to inhibit the growth and accumulation of S. mutans on the surface of the tooth. This prevents the accumulation of acids on the surface of the tooth, and further demineralization and breakdown of the tooth enamel.

Allium sativum(Garlic) has antimicrobial activity against oral microorganisms in which 2.5 and 3% concentrations showed good antimicrobial activity against S. mutans.

Curcumin longa(Turmeric) is the bioactive component of turmeric and has a wide spectrum of actions like anti-inflammatory, anti-oxidant, antibacterial, antifungal, antiprotozoal and antiviral activities.

Psidium guajava(Guava) has an anti-inflammatory action with its ability to inhibit prostaglandin, kinin and histamine.

Punica grane tum (Pomegranate) is found to be efficacious against Candida and the cariogenic bacteria with high reserves of tannins and polyphenols acknowledged for their antibacterial activity.

Azadirachta indica(Neem) has been proved to be effective against E. faecalis and Candida albicans.

Salvadora persica(Miswaak/tooth brush tree) is antimicrobial in its action and is used as a traditional oral hygiene aid.

Sedative and anxiolytic activity
Melissa officinalis (Lemon balm), derived from dried leaves, contains volatile oils responsible for its mild sedative, anxiolytic and hypnotic effects.

Valerencic acid inhibits the enzyme system causing a breakdown of GABA in the brain and consequent increase in GABA levels is associated with sedation and decrease in CNS activity.
Clinical applications
Herbs have been used as an antimicrobial agent against various endodontic pathogens. Herbs have also been long used in various endodontic medicaments and dressings with obtundent and soothing effects.

1. Endodontic applications:
1.1 Endodontic irrigants:
High antimicrobial activity of *Salvadora persica* (Miswaak) extract against aerobic and anaerobic microorganisms was demonstrated at 15% concentration. Use of *Azadirachta indica* (Neem) as an endodontic irrigant might be advantageous because it is a biocompatible antioxidant and thus not likely to cause the severe injuries to patients that might occur via NaOCl accidents.*Morinda citrifolia* (Indian mulberry) was more effective than chlorhexidine in removing the smear layer. The efficacy of *M. citrifolia* was similar to sodium hypochloride (NaOCl) in conjunction with EDTA as an intracanal irrigant. Green tea exhibits antibacterial activity on E. faecalis cells. It is also found to be a good chelating agent.

Aqueous extracts of both *Allium cepa* (Liliaceae) and *Allium sativum* (Liliaceae) have shown good antimicrobial activity against Gram-positive and Gram negative bacterial species and fungi, with the *A. sativum* (garlic) extract showing better results.

Propolis is a resinous mixture that honey bees collect from tree buds, sap flows, or other botanical sources and contains flavonoids. Its actions include antimicrobial, antiinflammatory, anesthetic, cytostatic and cariostatic effects.

1.2 Endodontic retreatment
Orange oil was suggested as an alternative to chloroform and xylol for endodontic re-treatment, since both have toxic and carcinogenic effects. This is composed mostly of d-limonene. It also has a long chain aliphatic hydrocarbon alcohols, aldehydes like octanal. It is suggested as an alternative to chloroform or xylene for gutta-percha softening and also in dissolving endodontic sealers.

1.3 Intracanal medicaments
Propolis exhibited good in vitro antibacterial activity against E. faecalis in root canals, suggesting that it could be used as an alternative intracanal medicament.

*Articum lappa* (Common or great burdock) has been investigated due to its antimicrobial potential against oral microorganisms specifically those associated with endodontic infections.

2. Pulp capping applications:
Propolis promotes bone regeneration and induction of hard tissue bridge formation in pulpotomy and pulp capping. The response of pulps to propolis as a pulp capping agent was comparable to MTA and Dycal.

3. Surgical applications:
Ankaferd Blood Stopper (ABS) is a standardized extract from the following plants: *Thymus vulgaris, Glycyrrhiza glabra, Vitis vinifera, Alpinia officinarum and Urtica dioica* in a weight ratio of 6:8:7:7:5, respectively. The basic mechanism of action of ABS is through the formation of encapsulated protein network providing focal points for vital erythrocytes to aggregate. ABS was found to be effective within 10–20 min in controlling bleeding in most of the patients after dental surgery.

*Calendula officinalis* (English marigold) flower extract treatment promotes wound to heal much faster attributable to its capability to enhance the synthesis of connective tissue, especially collagen. Aloe vera extract reduces incidence of alveolar osteitis compared with clindamycin-soaked Gelfoam.

*Curcumin longa* (Turmeric) was shown to be effective in reducing wound-healing time and acts as proangiogenic agent, playing a role in remodeling phase of wound repair.

4. Periodontal applications:
*Marricaria chamomilla* (Asteraceae) has anti-inflammatory properties that reduce gingival inflammation; *Echinacea purpurea* (Asteraceae) stimulates immune response; *S. officinalis* (Lamiaceae) has antihemorrhagic properties; *Commiphora myrrha* (Burseraceae) has natural antiseptic properties and *M. piperita* (Lamiaceae) has analgesic, antiinflammatory and anti-inflammatory properties.

A mouthrinse containing Aloe vera was found to reduce gingival inflammation and gingival bleeding and was more effective than Listerine in reducing counts of aerobic, microaerophilic and anaerobic bacteria. *Punica granatum* (Pomegranate) extract decreased the number of colony forming units of dental plaque bacteria by 84%, comparable to chlorhexidine.

Use of *Salvadora persica* (Miswaak) mouthwash resulted in improved gingival health and lower carriage rate of cariogenic bacteria when compared with the pre-treatment values.

5. Oral mucosal healing applications:
Herbal treatments are generally palliative in character. Aloe vera gel accelerates the healing of aphtous ulcers and reduces the pain associated with them. *Krameria triandra* (Rhatany) acts by the astringent rhataniatannic acid whose infusions have been used as a gargle and lozenges.

*Glycyrrhiza glabra* (licorice) controls the pain and reduces the healing time of recurrent aphtous ulcer. The activity of *Coriander sativum* oil has the potential as natural antifungal formulation. Cytopathic effect of herpes simplex virus (HSV-2) was reduced with the use of *Melissa Officinalis* (Lemon balm).
6. Dental trauma applications:
In vivo studies showed that teeth maintained in propolis medium exhibited replacement resorption with significant reduction in tooth length, similar to teeth maintained in saliva and dried teeth.\(^{(19)}\) *Salvia officinalis* (Garden sage) extracts serve as a storage medium for the maintenance of PDL cell viability of avulsed teeth.\(^{(20)}\) skinned and whole milk, followed by natural coconut water and HBSS, were the most effective media in maintaining cell viability of PDL fibroblasts.\(^{(21)}\) *Morus rubra* (Indian mulberry) can be recommended as a suitable transport medium for avulsed teeth.\(^{(22)}\) Efficacy of *Camellia sinensis* (Green Tea) extract in maintaining the viability of human PDL cells is similar to that of HBSS and higher than that of milk.\(^{(23)}\)

7. Applications in dental materials:
The commonly used materials in routine dental practice of herbal origin includes zinc oxide eugenol cement, impression materials (agar agar and alginate), gutta-percha root canal filling material, citric acid, camphorated monochlorophenol medicament and thymol.

Side effects of phytodentistry
Allergy: Tea tree oil, extracted from *M. alternifolia*, has been reported as causing allergic contact dermatitis.\(^{(44,45)}\) Allergic reactions might also be associated with *E. purpurea*, *M. officinalis* and *A. sativum*, might also cause contact dermatitis.\(^{(46,47)}\) Allergic conjunctivitis has been associated with chamomile (*M. chamomilla*) tea.\(^{(48)}\)

Gastrointestinal effects: *E. purpurea* and *V. officinalis* might cause gastrointestinal upsets or dysfunction.\(^{(49)}\) Nausea and diarrhoea were reported when lemon balm was used at doses of 900 and 1200 mg/day.\(^{(50)}\)

Central nervous system effects and other systems: *V. officinalis* showed side effects such as headache, dizziness and residual sedation was observed at 900 mg doses.\(^{(51)}\) *P. incarnata* caused vasculitis in patients suffering from insomnia.\(^{(52)}\)

Phytotherapeutic interactions
*M. chamomilla* has a theoretical risk for potentiation of the anticoagulation effects of warfarin.\(^{(53)}\) *V. officinalis* was reported to prolong thiopental and pentobarbital induced sleep. It is wise to avoid the concurrent use of valerian and barbiturates and/or benzodiazepines.\(^{(54)}\) *P. incarnata* should be taken cautiously when used concomitantly with other CNS depressants, stimulants and phenelzine, a MAO inhibitor agent.\(^{(55)}\)

*V. officinalis* combined with alcohol and barbiturates might increase sedative and hypnotic effects.\(^{(56)}\)

Conclusion
Many herbal drugs have potential medicinal properties; however, the literature is scarce with regard to information on the quality, safety and efficacy of herbal plants for use in dentistry. Further studies are needed to investigate the side effects, toxicity and drug interactions of these plants for dental applications.
