Abstracts
Periodontitis is an inflammatory disease affecting supportive tissues of the teeth, leading to progressive destruction of connective tissue attachment and the alveolar bone. This destruction is characterized by the formation of a periodontal pocket. Because of its chronic inflammatory infectious nature, periodontitis has been considered a systemic exposure implicated with causative agent in variety of systemic diseases and condition. Recent findings have suggested that periodontal diseases are associated with a higher risk of cardiovascular diseases, atherosclerosis and adverse pregnancy outcomes, such as preterm birth and low birth weight and preeclampsia.

Keywords: Periodontitis, Preeclampsia, Preterm low birth weight babies.

Introduction
Periodontitis is an inflammatory disease affecting supportive tissues of the teeth, leading to progressive destruction of connective tissue attachment and the alveolar bone. This destruction is characterized by the formation of a periodontal pocket.

Because of its chronic inflammatory infectious nature, periodontitis has been considered a systemic exposure implicated with causative agent in variety of systemic diseases and condition. Recent findings have suggested that periodontal diseases are associated with a higher risk of cardiovascular diseases, atherosclerosis and adverse pregnancy outcomes, such as preterm birth and low birth weight.¹ and preeclampsia.²

Preeclampsia is a multi factorial disorder affecting approximately 10% of pregnancies and contributes significantly to maternal and perinatal morbidity and mortality.² It usually occurs after 20 weeks of gestation. It is characterized by abnormal vascular response to placenta, reduced organ perfusion, vasospasm, activation of coagulation system, inflammatory like response, oxidative stress, and some perturbation in volume and blood pressure control, affecting the placenta, kidney, liver, and brain. Preeclampsia is determined by maternal blood pressure elevation accompanied by proteinuria.³

What is Preeclampsia and pre term low birth weight baby?: Preeclampsia can be defined as blood pressure >140/90 mm of Hg on two separate occasion after 20 week of gestation and at least 1+ proteinuria.²

The World Health Organization defines preterm birth as any live birth at less than 37 weeks of gestation. Delivery at less than 32 weeks is termed very preterm, and delivery at less than 28 weeks is extremely preterm. The majority of preterm births are also low birth weight. The international definition of low birth weight adopted by the Twenty-ninth World Health Assembly in 1976 is a birth weight of “less than 2500 g.”⁵

Etiology of preeclampsia
Periodontal infections increases the burden of endotoxins, inflammatory cytokines on vessels⁶Effects on Feto - Placental unit blood vessels leading to Atherosclerotic lesions of the spiral arteries⁴ causing Ischemia,⁴Oxidative and inflammatory vascular damage,⁴ Endothelial damage in the placental vascular bed⁴and Preeclampsia⁴
Risk factors for preterm low birth weight babies ⁶
1. Primary present before pregnancy, 2. Secondary develop during pregnancy
Possible role of periodontitis in causing pre term low birth weight babies⁷

Tissue invading gm – ve bacteria release endotoxins which triggers release of inflammatory mediators like cytokine and PGE 2. Inflammatory Mediators are increased in Amniotic Fluid as well. Causing premature rupture of the membrane.

Diagnostic factors of preeclampsia/ pre term low birth weight babies

Blood pressure $>140/90$ mm of Hg at 20 weeks of gestation Proteinuria, quantification of protein excretion over 24 hours is the gold standard method.

The international definition of low birth weight adopted by the Twenty-ninth World Health Assembly in 1976 is a birth weight of “less than 2500 g.”\textsuperscript{5}

Conclusion

Because of its chronic inflammatory infectious nature, periodontitis has been considered a systemic exposure implicated with causative agents in a variety of systemic illnesses. Recent findings have suggested that periodontal disease is associated with a higher risk of preeclampsia and pre term low birth weight babies.

Associations between preeclampsia, preterm low birth weight babies and periodontitis should be interpreted with discretion, because the etiology of both events is likely multifactorial. It is important to emphasize that primary healthcare services must be proficient to diagnose and manage periodontal disease all through pregnancy.

Managing periodontal disease may represent a novel strategy to reduce the incidence and/or complications from adverse pregnancy outcomes.
